Weather Report documentation

For this project, I used create react app for basic react setup to make weather report.

In the project directory, you can run:

`Create-react-app [foldername]`
To install and initiate nodejs module inside folder.

`npm install`
To get install dependencies of project, use this code.

`npm start`
Runs the app in the development mode.
Open http://localhost:3000 to view it in the browser.

The page will reload if you make edits.
You will also see any lint errors in the console.

`npm test`
Launches the test runner in the interactive watch mode.
See the section about running tests for more information.

`npm run build`
Builds the app for production to the `build` folder.
It correctly bundles React in production mode and optimizes the build for the best performance.
The build is minified and the filenames include the hashes.
Your app is ready to be deployed!

Linting:

They are not required for linting. You should see the linter output right in your terminal as well as the browser console. This is because Create React App intentionally provides a minimal set of rules that find common mistakes.
